Abstract

The present study carried out during 2021 and 2022 seasons is to investigate the promotive effect of spraying Saidy date palm bunches with Micro-nutrients and Amino acids on yield and fruit physical and chemical characteristics. Bunches were sprayed with Micro-nutrients at 250,500 ppm or 1000 ppm and Amino acid at 5000-ppm. The Micro-nutrients and Amino acids were sprayed individually or in combination. Results indicated that all spray treatments significantly increased. The yield improved the physical and chemical characteristics of fruits compared with untreated bunches. Spraying bunches with Micro-nutrients at 500 or 1000 ppm alone or in combination with Amino acid at 5000 ppm was more effective in increasing the yield and improving physical and chemical fruits properties.

Keywords: Date palm, Fruit yield, Fruit quality, Micro-nutrients, Amino acids

Introduction

Date palm (*Phoenix dactylifera L.*) one of the most important fruit crops grown in semiarid and arid- regions. In Egypt, many farmers rely on date palms cultivation and exportation of their fruit. According to **FAO (2010)**, Egypt is considered the leading country among the top ten date producers (1,130,000 tons). 'Saidy' is one of the most commercial and semi-dry cultivars in Egypt. Fruit trees are seriously impacted by climatic; the fruit trees are facing many challenges regarding their productivity due to changing climatic conditions (**Normand et al., 2013**). The yield and fruit quality are directly affected by climatic factors i.e. high temperature, increasing CO₂ levels low soil moisture and high evaporative. Therefore, under changing climate, the management of natural resources like nutrients and water is a possible solution (**Schaffer et al., 2009**). Moreover, major problems. Facing date growers as low annually average of yield and fruit quality. Minerals element especially micro-nutrients have an important role for increasing yield and fruit quality and It increase the tolerance of trees for many stresses, therefore determination the optimum levels for them is a necessity for date palm Orchards management. Foliar application of Micro-nutrients and Amino acids are the key to improve the productivity and fruits quality, as well as it has a beneficial role in reclamation of nutritional and physiological deficiency in fruit trees (**Rai, 2002; Lalithya et al., 2014 and Khan et al., 2020**).

Spraying micro-nutrients leads to improved yield and fruit quality as well as improved fruit retention (**Sarrwy et al., 2012; Omar et al., 2014 and Mostafa, 2015**). In this concern, boron is involved in many processes such as protein synthesis, transport of sugars and carbohydrate metabolism (**Hansch and Mendel, 2009**). It appears that the effect on date productivity and fruit quality is through some micro-elements such as boron, which plays an important role in achieving satisfactory fruit quality. It is involved in many physiological

processes such as sugar transport, carbohydrate metabolism and protein synthesis. (**Etman et al., 2007 and Khayyat et al., 2007**). Spraying of date palm inflorescences with calcium nitrate and/or boric acid had a significant impact on fruit set, yield, and fruit quality traits (**Harhash and Abdel Nasser 2010, Sarrwy et al., 2012, 2010; Omar et al., 2014; Mostafa, 2015; Merwad et al., 2019**)

Amino acids are among the most important antioxidants that play a clear role in solving the problem of poor yield by enhancing the nutritional status of growth, yield, and fruit quality in various fruit trees and have synergistic effects on growth and productivity of most fruit trees (**Khan et al., 2012; Merwad et al., 2015 and Khan et al., 2020**). Amino acids have a defensive role against fungal attack, cell aging and oxidative stress, in addition to promoting cell division and growth. Moreover, they improve flowering and fruit set, especially under stressful conditions (**Hayat and Ahmed, 2007; Al-Salhy et al., 2021**). The application of Amino acids for foliar use depends on the necessity of crops in general and at critical growth stages in particular and the demand for essential Amino acids is well known as an application to enhance productivity and fruit quality. Many studies have shown the proven role of Amino acids in increasing yield and improving fruit quality traits (**Rai, 2002; Khan et al., 2020; El-Salhy et al., 2021; Abdel-Ghany, 2021 and El-Kady et al., 2022**).

Many previous studies emphasized the benefits of Micro-nutrients and Amino acids in improving the fruiting of date palm trees (**Rai, 2002; Harhash and Abdel-Nasser, 2010; Sarrwy et al., 2012; Omar et al., 2014, Mostafa, 2015, Merwad et al., 2019, Khan et al., 2020; El-Salhy et al., 2021; Abdel-Ghany, 2021 and El-Kady et al., 2022**)

Therefore, the present study was planned to know the effect of foliar application of Fetrilon compi (NC) (Micro-nutrients) and amino acids on yield and fruit quality of Saidy date palm.

Materials and Methods

This study was conducted during the two successive seasons of 2021 and 2022 on 20-year-old Saidu palm trees. The chosen palm trees were planted in the Baris Oasis, New Valley Governorate, Egypt, on sandy loamy soil. The laboratory work was conducted in the Horticulture Department Faculty of Agriculture, New Valley University. Seven healthy palms nearly similar in growth vigor were selected. Regular agricultural practices were carried out as usual. The leaf/bunch ratio was adjusted at the end of the blooming season to meet its value of 8:1 leaving 8 bunches on each palm. Artificial pollination was uniformly performed in respect of source, date and method to avoid the effect of metaxenia. Spraying treatments were carried twice-immediately after fruit set and at the beginning of coloring as follows:

- 1- Control (spraying with water only)
- 2- Spraying the bunches with Nutrimix Complete (Micro-nutrients) at 250 ppm
- 3- Spraying the bunches with Nutrimix Complete at 500 ppm
- 4- Spraying the bunches with Nutrimix Complete at 1000 ppm.
- 5- Spraying the bunches with Amino acid at 5000 ppm.
- 6- Spraying the bunches with Nutrimix Complete at 250 ppm plus Amino acids at 5000 ppm

Fruit retention %

$$= \frac{\text{Total number of retained fruits strand}}{\text{Number of retained fruits / strand and flowers no. flower scars}} \times 100$$

The bunches were picked at the beginning of September when the fruits reach the Routab stage. The average crop weight/palm and bunch weight was recorded at kilograms.

Fruit physical characteristics:

Fruit was selected at random from each bunch to determine physical properties such as fruit weight (g), fruit dimensions (cm) (Length and diameter), and flesh %.

Fruit chemical characteristics:

Chemical properties i.e. total soluble solids content (T.S.S.) % was determined using hand refractometer, also percentage of

7- Spraying the bunches with Nutrimix Complete at 500 ppm plus Amino acids at 5000 ppm

8- Spraying the bunches with Nutrimix Complete at 1000 ppm plus Amino acids at 5000 ppm Triton B was added as a 0.05% wetting agent to each spray solution before use.

The chemical composition of the applied **Amino acid is: Super viga MaxR** (Commercial product produced by union for agricultural Development Co. (USD), Egypt,) containing 17.5% amino acid W / V

The design of the experiment is complete randomized block design that contain 8 treatments and 7 replications, the bunch/palm is considered as a replicate.

All spray treatments were thoroughly applied on bunches using a hand sprayer (2 liters capacity). The response of Saidu date palms to micro-nutrients or amino acid and their combinations were evaluated through the following determinations.

Yield components such as fruit retention, bunch weight.

The fruit retained percentages were calculated at time from five inner and outer strands per bunch. The percentages of fruit retention were calculated using the following equation:

total acidity as gm. citric acid/100gm fruit and total tannins. Reducing sugar %, non-reducing sugars % and total sugars % were determined according to **A.O.A.C. (1995)**.

Statistical analysis:

The obtained data during two studied seasons were subjected to analysis of variance according to **Snedecor and Cochran (1990)**. Means were differentiated using values of new LSD at 5% level.

Results

1- Yield components: Data in Table (1) showed that the effect of Micro-nutrients (NC) and Amino acids (Aa) on yield

components of Saidu date palm during 2021 and 2022 seasons. It is obvious from the data that results showed similar trend during the two studied seasons.

Results indicate that yield components i.e. fruit retention, bunch weight / kg significantly increased due to spraying Micro-nutrients (NC) by the different concentrations or amino acids (Aa) compared to (control). It could be noticed that all spraying treatments significantly increased fruit retention as compared with control. In this respect, the best treatment that gave the highest significant fruit retention was (70.37 & 70.36%) as an av. of the two studied seasons due to 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ or 500 ppm Micro-nutrients (NC) plus Amino acid (Aa) 5000 ppm T₇ followed by 250 ppm (NC) plus 5000 ppm (Aa) T₆ as an av. of the two studied seasons. Control treatment gave the lowest significant fruit retention, where it was recorded (63.68%) as an av. of the two studied seasons. No significant differences were found due to spraying Micro-nutrients (NC) alone or Micro-nutrients (NC) plus Amino acids (Aa). Therefore, in general economic

view, it concluded that to spray Micro-nutrients (NC) alone or in combination with Amino acids (Aa) at lower concentrations.

Concerning the bunch weight, results in the same table reveal that, Micro-nutrients (NC) and Amino acid (Aa) singly or in combinations had a positive effect on bunch weight as compared with the control due to 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ or 500 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₇ or 250 ppm (NC) plus 5000 ppm (Aa) T₆ gave the highest bunch weight (13.15, 13.04 and 12.65) followed by 500 ppm Micro-nutrients (NC) or 1000 ppm Micro-nutrients (12.29 & 12.34kg) as an av. of the two studied seasons. On the other hand, control treatment recorded the lowest bunch weight (10.62kg) as an av. of the two studied seasons. The recorded bunch weight was (10.62, 11.53, 12.29, 12.34, 11.93, 12.65, 13.04 & 13.15kg) as an av. of the two studied seasons due to T₁ to T₈, respectively. Then, the corresponding increment percentage of bunch weight due to treatments over control attained (8.57, 15.73, 16.20, 12.34, 19.21, 22.79 & 23.82%), respectively.

Table (1): Effect of spraying Micro-nutrients and Amino acid on yield component of Saidu date palm during 2021 and 2022 seasons.

Treatments		Fruit Retention %			bunch Weight (kg)		
		2021	2022	Mean	2021	2022	Mean
Control	T ₁	60.25c	67.10c	63.68D	9.88D	11.36D	10.62D

New LSD 5%		2.36	2.49	1.78	0.46	0.61	0.41

2- Fruit quality

A- Fruit physical characteristics: Results in Tables (2 & 3) indicate that fruit weight, fruit dimensions and flesh percentage were significantly affected by different treatments during two studied seasons. In general, spraying 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ or 500

ppm Micro-nutrients (NC) plus Amino acid (Aa) 5000 ppm T₇ followed by 250 ppm (NC) plus 5000 ppm (Aa) T₆ significantly increased the previously studied traits compared to control.

Moreover, 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ was achieved higher fruit weight (10.84g)

and flesh % (87.48%) and fruit length (3.79 cm) and fruit diameter (2.18cm) as av. of the two studied seasons compared with the other treatments and control, while the control recorded the lowest value in this respect, fruit weight (9.47g), flesh % (84.99%) and fruit length (3.52cm) fruit diameter (2.05cm) as an av. of two studied seasons, respectively.

The recorded fruit weight was (9.47, 9.91, 10.33, 10.38, 10.17, 10.50, 10.80 & 10.84g) and flesh % was (84.99, 87.07, 87.17, 87.33, 87.08, 87.38, 87.42& 87.48%) and Moisture % was (15.20 , 15.85, 15.98, 16.43, 15.98, 16.31, 16.40& 16.41%) and fruit length was (3.52, 3.64, 3.68, 3.72, 3.72,3.76, 3.76& 3.79 cm) and fruit diameter

was (2.05, 2.12, 2.15, 2.16, 2.13,2.16, 2.18& 2.18 cm) as an av. of the two studied seasons due to T₁ to T₈, respectively.

Moreover, the increment percentage of fruit weight due spraying Micro-nutrients or Amino acids compared to control attained (10.46, 10.91, 10.96, 10.74, 11.09, 11.40& 11.45%), respectively.

These results showed that there were no significant differences due to increasing the concentration of Micro-elements or Amino acid solution. Therefore, from an economic point of view, it can be concluded that the best treatment is spraying with a concentration of 1000 ppm of Micro-elements (NC) in addition to 5000 ppm of the Amino acid (Aa) T₈.

Table (2): Effect of spraying Micro-nutrients and Amino acid on fruit weight, flesh% and Moisture % of Saihy dates during 2021 and 2022 seasons

Treatments	Fruit Wight(g)			Flesh%			Moisture%

B- Fruit chemical characteristics: It is clear from the results in Tables (4, 5 & 6) that spraying Micro-nutrients and Amino acid, led to a significant improvement in fruit chemical properties, in terms of increasing T.S.S%, sugar contents and decreasing the acidity and tannins in relative to the control treatment. As for T.S.S %, and sugar contents, the results in Tables (4 & 5) reveal that using foliar application of 1000 ppm Micro-nutrients (NC) plus 5000-ppm Amino acid (Aa) T₈ followed by 500 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₇ in descending order gave better results (74.48& 74.39%) and (64.77&64.80%) as an av. of the two studied seasons for T.S.S and total sugars due to T₈ and T₇, respectively. On the other hand, control scored the lowest value in this respect (70.08& 60.38%), respectively.

The recorded T.S.S was (70.08, 71.89, 72.56, 73.42, 72.89, 73.95, 74.39& 74.48%) and total sugar was (60.38, 62.54, 63.10, 63.73, 63.37, 64.29, 64.77& 64.80%) as an av. of the two studied seasons due to T₁, T₂, T₃, T₄, T₅, T₆, T₇and T₈ respectively. Then, the corresponding increment percentage of total sugar attained (3.58, 4.50, 5.55, 4.85, 6.48, 7.27 & 7.32%) due to T₂ to T₈ compared to T₁, respectively.

The values of non-reducing sugars percentage were (5.00, 5.47, 5.68, 5.68, 5.61, 5.67, 5.48 and 5.45%) as an av. the respectively two studied seasons due to using T₁, T₂, T₃, T₄, T₅, T₆, T₇ and T₈, respectively.

Moreover, no significant differences were found due to spray 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ followed by 500 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₇.

As for acidity % and tannins contents, all spray treatments of these studied characteristics decreased compared to the control, and the lower values in this respect was (0.182 & 0.433%) and (0.177 & 0.423%) as an av. of two studied seasons were obtained by 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ followed by 500 ppm micro-nutrients (NC)

plus 5000 ppm Amino acid (Aa) T₇, respectively. Meanwhile, control treatment gave the highest value in this respect (0.210& 0.509 %) as an av. of two studied seasons.

Hence, the decrement percentage of tannin contents attained (0.509, 0.471, 0.465, 0.453, 0.467, 0.440, 0.433and 0.423 %) as an av. of the two studied seasons due to the use of T₂ to T₈ compared to T₁, respectively.

The corresponding B-Carotene was (0.681, 0.759, 0.715, 0.721, 0.712, 0.725, 0.730 and 0.723) as an av. the two studied seasons due to T₁, T₂, T₃, T₄, T₅, T₆, T₇ and T₈, respectively.

In general, the lowest percentage of fruit chemical properties except acidity and tannins contents were found in control. On the other hand, spraying 1000 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₈ followed by 500 ppm Micro-nutrients (NC) plus 5000 ppm Amino acid (Aa) T₇ recorded the highest value in this respect. No significant differences were found due to spraying Micro-nutrients alone or Micro-nutrients plus Amino acids in any concentration of spraying solution. Therefore, in general, the economic view concluded that spraying Micro-nutrients alone or in combination with Amino acids at lower concentrations to get a high yield with good date quality.

Discussion

In this research, Micro-nutrients and Amino acids were used to enhance the Productivity and fruit properties of Saidu date palm fruits. One of the most widely used bio stimulants in agriculture is amino acids (Rai, 2002).

Moreover, they are substances that increase the availability of nutrients, enhance quality traits and promote plant growth. Amino acids can function as signaling molecules in plant cells under stressed and non-stressed conditions and precursors for the production of secondary metabolites (Rai, 2002 and Khedr, 2018). In this regard, many studies have reported that Amino acids have a positive effect in improving fruit characteristics and productivity (El-Salhy *et*

al., 2017; Al-Najjar *et al.*, 2020 and El-Kady *et al.*, 2022).

The results obtained were confirmed with those obtained by (Omer *et al.*, 2014), who reported that the percentage of fruit retention and bunch weight, as well as the productivity of the Saidy date palm variety, were improved by using zinc and boron. In this regard, the tentative explanation is that zinc and boron increase the removal power due to their participation in several enzymatic reactions that regulate carbohydrate metabolism essential for growth, development and protein (Swietlik, 1999 and Sarrway *et al.*, 2012). The obtained results are almost the same as those obtained by (El-Sawy 2005, Khayyat *et al.* 2007, Harhash and Abdel-Nasser 2010, Soliman and Obeed 2011, Osman *et al.* 2011, Mahmoud 2012, Elkhyat and El-Noam 2013, Omar *et al.* 2014, Roshdy 2014 and Mostafa 2015). The quality of the fruits of the Saidy date palm variety was improved by using Amino acids, Zinc and Boron. Zinc and Boron play a major role in many processes, especially carbohydrate metabolism and the transfer of sugars and

proteins, which increases cell division and enlargement, leading to accelerated fruit ripening, as well as increasing the weight and dimensions of the fruit. In addition, the amounts of Amino acids and essential Micro-nutrients that promote cell division and enlargement lead to accelerated fruit ripening in addition to increasing the weight and size of the fruit. These results are consistent with those obtained by (Ashour *et al.* 2004, El-Sawy 2005, Khayyat *et al.* 2007, Harhas and Abdel-Nasser 2010, Sarrwy *et al.* 2012, Mahmoud 2012, Oraby 2013, Roshdy 2014, Omar *et al.* 2014 and Mostafa 2015).

Conclusion

From the current study, it can be concluded that fruit yield and fruit physical and chemical characteristics were improved significantly by bunches twice foliar application with 500 ppm Micro-nutrients alone or combination with 5000 ppm Amino acids. These treatments were the best and the most effective treatments in enhancing yield and improving fruit quality of Saidy date palms.

الملخص العربي

أجريت هذه الدراسة خلال موسمين متتاليين 2021 و2022 علي نخيل البلح الصعيدي المنزرع بواحة الخارجة بمركز باريس محافظة الوادي الجديد – مصر، بهدف دراسة تأثير رش نوتريميكس كومبليت (المغذيات الدقيقة) والأحماض الأمينية علي إثمار نخيل البلح الصعيدي حيث تم الرش بتركيزات 250 و 500 و 1000 جزء في المليون من مركب نوتريميكس كومبليت (المغذيات الدقيقة) بالإضافة إلى 5000 جزء في المليون من الأحماض الأمينية. وقد أظهرت النتائج ما يلي:

سبب الرش بمركب نوتريميكس كومبليت (المغذيات الدقيقة) أو الأحماض الأمينية في حالة فردية أو معاً زيادة معنوية في نسبة الثمار الباقية ووزن السوباطة وبالتالي وزن المحصول / نخلة مقارنة بعدم الرش (معاملة المقارنة). سبب الرش بتركيز 1000 جزء في المليون من مركب نوتريميكس كومبليت (المغذيات الدقيقة) بالإضافة إلى 5000 جزء في المليون من الأحماض الأمينية تليها 500 جزء في المليون من مركب نوتريميكس كومبليت (المغذيات الدقيقة) بالإضافة إلى 5000 جزء في المليون من الأحماض الأمينية. سواء في حالة فردية أو معاً زيادة معنوية في وزن وأبعاد الثمرة ونسبة اللحم. كذلك محتواها من المواد الصلبة الذائبة أو السكريات مع قلة الحموضة والتانينات مقارنة بعدم الرش.

لم تسجل فروق معنوية بين استخدام مركب نوتريميكس كومبليت (المغذيات الدقيقة) سواء فردية أو خليط مع الأحماض امينية ولذا من الناحية الاقتصادية يفضل استخدام التركيز الأقل 500 جزء في المليون من مركب نوتريميكس كومبليت (المغذيات الدقيقة) بالإضافة إلى 5000 جزء في المليون من الأحماض الأمينية من نتائج هذه الدراسة فإنه يوصي بأهمية رش سوباطات البلح الصعيدي بتركيز 500 جزء في المليون من مركب نوتريميكس كومبليت (المغذيات الدقيقة) بالإضافة إلى 5000 جزء في المليون من الأحماض الأمينية خلال فترة نمو الثمار وذلك لإنتاج محصول عال نو خصائص ثمرية جيدة.

الكلمات الدالة: نخيل البلح الصعيدي- المغذيات الدقيقة - الاحماض الامينية
